Surprisingly, UNIX—the operating system of choice for mission-critical networks—has historically had little documentation on its filesystem structures.

File system implementation defines how files and directories are stored, how disk space is managed, and how to make everything work efficiently and reliably. ... In a simple design a directory consists of a list of fixed-size entries, one per file, containing a (fixed-length) file name, a structure of the file attributes, and one or more disk

System design is the phase that bridges the gap between problem domain and the existing system in a manageable way. This phase focuses on the solution domain, i.e. “how to implement?” It is the phase where the SRS document is converted into a format that can be implemented and decides how the system will operate.
